

# Stackelberg ILQGames Writeup

Hamzah Khan

November 13, 2022

In this document, we describe the alterations made to the ILQGames algorithm described in *Efficient Iterative Linear-Quadratic Approximations for Nonlinear Multi-Player General-Sum Differential Games* (Fridovich-Keil et al. 2020) made to adapt it to solve nonlinear, non-quadratic 2-player Stackelberg games.

We assume no affine terms in this initial draft. **TODO: adjust to include affine terms.**

## 1 Steps

The algorithm accepts a number of inputs:

- initial state  $\mathbf{x}_0$ ,
- a horizon  $T$  over which the game is played,
- cost functions  $g_t^i$ ,  $i \in \{1, 2\}$  at each time step  $t$ ,
- initial control strategies  $\gamma_{k=0}^i$  described by the gain matrix  $S_{t,k=0}^i$  and the recursive cost matrix  $L_{t,k=0}^i$ ,  $i \in \{1, 2\}$ .

We pre-select arbitrary reference state and controls to be

$$\mathbf{x}_t = 0, \quad \mathbf{u}_t^i = 0 \quad \forall i \in \{1, 2\}$$

and  $\eta \in (0, 1]$ .

At each iteration  $k = 1, 2, \dots$  until convergence condition  $\|\Delta\gamma_k^i\| < \text{threshold } \epsilon$ ,

1. Propagate  $\gamma_{k-1}^i$  forward in time from  $\mathbf{x}_0$  to get  $\xi_k \equiv \{\hat{\mathbf{x}}_{1:T}, \hat{\mathbf{u}}_{1:T}^i\}$ .
2. Compute errors

$$\delta\mathbf{x}_t = \mathbf{x}_t - \hat{\mathbf{x}}_{1:T}, \quad \delta\mathbf{u}_t^i = \mathbf{u}_t^i - \hat{\mathbf{u}}_{1:T}^i.$$

3. Linearize the dynamics and quadraticize about the error state and controls.

$$A_t = \frac{\partial f_t(\hat{\mathbf{x}}_t, \hat{\mathbf{u}}_t^i)}{\partial \hat{\mathbf{x}}_t}, \quad B_t^i = \frac{\partial f_t(\hat{\mathbf{x}}_t, \hat{\mathbf{u}}_t^i)}{\partial \hat{\mathbf{u}}_t^i}$$
$$Q_t^i = \nabla_{\hat{\mathbf{x}}} \hat{\mathbf{x}}_t^i g_t^i, \quad R_t^{ij} = \nabla_{\hat{\mathbf{x}}} \hat{\mathbf{u}}_t^i g_t^j$$

4. Solve LQ Stackelberg game  $\gamma_k^i = \mathcal{S}_t^1(A_t, B_t, \{Q_t^i\}, \{R_t^{ij}\}, T; \mathbf{x}_0) = \{S_{t,k}^i, L_{t,k}^i\}$ .
5. Adjust the control strategies based on this approximate solution:

$$\gamma_k^i = \hat{\mathbf{u}}_t^i - S_{t,k}^i \delta \mathbf{x}_t.$$
